SECURITIES AND EXCHANGE COMMISSION**
Washington, D.C. 20549

Form 8-K

**CURRENT REPORT
Pursuant to Section 13 or 15(d)
of the Securities Exchange Act of 1934**

Date of Report (Date of earliest event reported): January 10, 2022

WAVE LIFE SCIENCES LTD.

(Exact name of registrant as specified in its charter)

Singapore
(State or other jurisdiction
of incorporation)

001-37627
(Commission
File Number)

00-0000000
(IRS Employer
Identification No.)

**7 Straits View #12-00, Marina One
East Tower
Singapore**
(Address of principal executive offices)

018936
(Zip Code)

Registrant's telephone number, including area code: +65 6236 3388

Check the appropriate box below if the Form 8-K filing is intended to simultaneously satisfy the filing obligation of the registrant under any of the following provisions (see General Instruction A.2. below):

- Written communications pursuant to Rule 425 under the Securities Act (17 CFR 230.425)
- Soliciting material pursuant to Rule 14a-12 under the Exchange Act (17 CFR 240.14a-12)
- Pre-commencement communications pursuant to Rule 14d-2(b) under the Exchange Act (17 CFR 240.14d-2(b))
- Pre-commencement communications pursuant to Rule 13e-4(c) under the Exchange Act (17 CFR 240.13e-4(c))

Indicate by check mark whether the registrant is an emerging growth company as defined in Rule 405 of the Securities Act of 1933 (§230.405 of this chapter) or Rule 12b-2 of the Securities Exchange Act of 1934 (§240.12b-2 of this chapter).

Emerging growth company

If an emerging growth company, indicate by check mark if the registrant has elected not to use the extended transition period for complying with any new or revised financial accounting standards provided pursuant to Section 13(a) of the Exchange Act.

Securities registered pursuant to Section 12(b) of the Act:

Title of each class	Trading symbol	Name of each exchange on which registered
\$0 Par Value Ordinary Shares	WVE	The Nasdaq Global Market

Item 7.01 Regulation FD Disclosure.

From time to time, Wave Life Sciences Ltd. (the “Company”) presents and/or distributes slides and presentations to the investment community to provide updates and summaries of its business. On January 10, 2022, the Company shared an investor presentation, which is available on the “For Investors & Media” section of the Company’s website at <http://ir.wavelifesciences.com/>. This presentation is also furnished as Exhibit 99.1 to this Current Report on Form 8-K.

The information in this Item 7.01 is being furnished and shall not be deemed “filed” for purposes of Section 18 of the Securities Exchange Act of 1934, as amended (the “Exchange Act”), or otherwise subject to the liabilities of that Section, nor shall it be deemed incorporated by reference into any registration statement or other filing under the Securities Act of 1933, as amended, or the Exchange Act, except as shall be expressly set forth by specific reference in such filing.

Item 9.01 Financial Statements and Exhibits.

(d) Exhibits

The following exhibit relating to Item 7.01 is furnished and not filed:

Exhibit No.	Description
99.1	Investor Presentation of Wave Life Sciences Ltd. dated January 10, 2022
104	Cover Page Interactive Data File (embedded within the Inline XBRL document)

SIGNATURES

Pursuant to the requirements of the Securities Exchange Act of 1934, the registrant has duly caused this report to be signed on its behalf by the undersigned hereunto duly authorized.

Forward-looking statements

This document contains forward-looking statements. All statements other than statements of historical facts contained in this document, including statements regarding possible or assumed future results of operations, preclinical and clinical studies, business strategies, research and development plans, collaborations and partnerships, regulatory activities and timing thereof, competitive position, potential growth opportunities, use of proceeds and the effects of competition are forward-looking statements. These statements involve known and unknown risks, uncertainties and other important factors that may cause the actual results, performance or achievements of Wave Life Sciences Ltd. (the "Company") to be materially different from any future results, performance or achievements expressed or implied by the forward-looking statements. In some cases, you can identify forward-looking statements by terms such as "may," "will," "should," "expect," "plan," "aim," "anticipate," "could," "intend," "target," "project," "contemplate," "believe," "estimate," "predict," "potential" or "continue" or the negative of these terms or other similar expressions. The forward-looking statements in this presentation are only predictions. The Company has based these forward-looking statements largely on its current expectations and projections about future events and financial trends that it believes may affect the Company's business, financial condition and results of operations. These forward-looking statements speak only as of the date of this presentation and are subject to a number of risks, uncertainties and assumptions, including those listed under Risk Factors in the Company's Form 10-K and other filings with the SEC, some of which cannot be predicted or quantified and some of which are beyond the Company's control. The events and circumstances reflected in the Company's forward-looking statements may not be achieved or occur, and actual results could differ materially from those projected in the forward-looking statements. Moreover, the Company operates in a dynamic industry and economy. New risk factors and uncertainties may emerge from time to time, and it is not possible for management to predict all risk factors and uncertainties that the Company may face. Except as required by applicable law, the Company does not plan to publicly update or revise any forward-looking statements contained herein, whether as a result of any new information, future events, changed circumstances or otherwise.

Building a leading genetic medicines company

LEVERAGING THE ONGOING GENETIC REVOLUTION

WAVE
LIFE SCIENCES

DRUGGING THE TRANSCRIPTOME TO UNLOCK THE BODY'S OWN ABILITY TO TREAT GENETIC DISEASE

Innovative Platform

- Stereopure oligonucleotides
- Novel backbone modifications (PN chemistry)
- Silencing, splicing, and editing modalities
- Strong and broad IP position¹

Clinical Expertise

- Multiple global clinical trials
- Innovative trial designs

Diversified Pipeline

- CNS: ALS, FTD, HD
- Muscle: DMD
- Hepatic diseases: AATD
- Ophthalmology

GMP Manufacturing

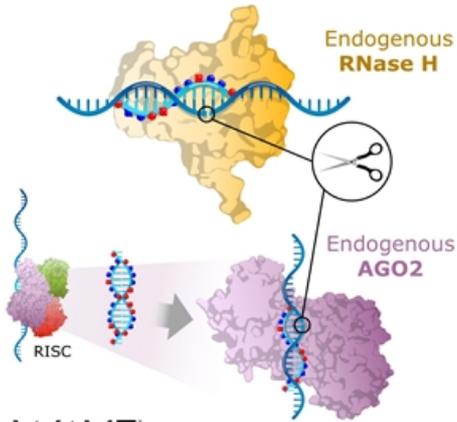

- Internal manufacturing capable of producing oligonucleotides at scale

ALS: Amyotrophic lateral sclerosis; FTD: Frontotemporal dementia; HD: Huntington's disease; DMD: Duchenne muscular dystrophy; AATD: Alpha-1 antitrypsin deficiency
¹stereopure oligonucleotides and novel backbone chemistry modifications

Biological machinery in our cells can be harnessed to treat genetic diseases

Silencing

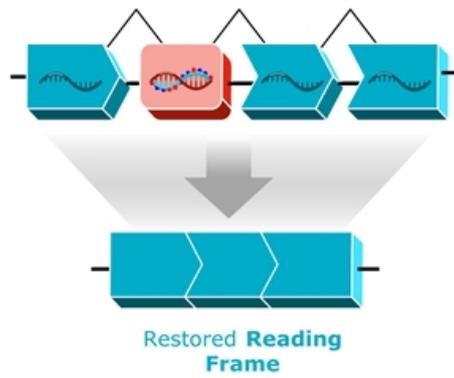

- Degradation of RNA transcripts to **turn off** protein production

WAVE[™]
LIFE SCIENCES

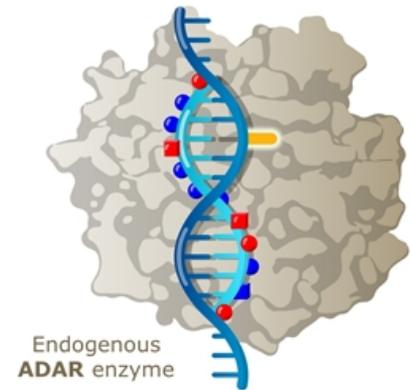

Splicing

- Restore RNA transcripts and **turn on** protein production

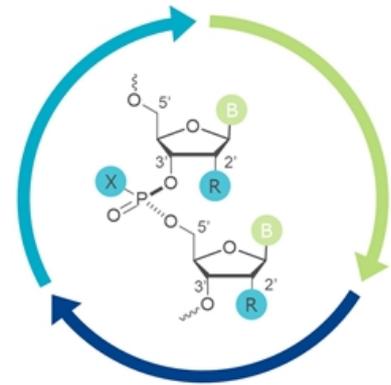

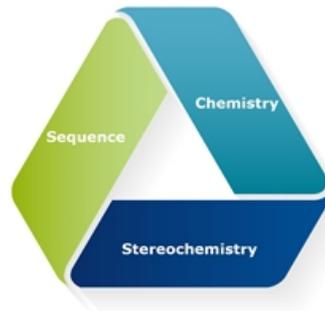

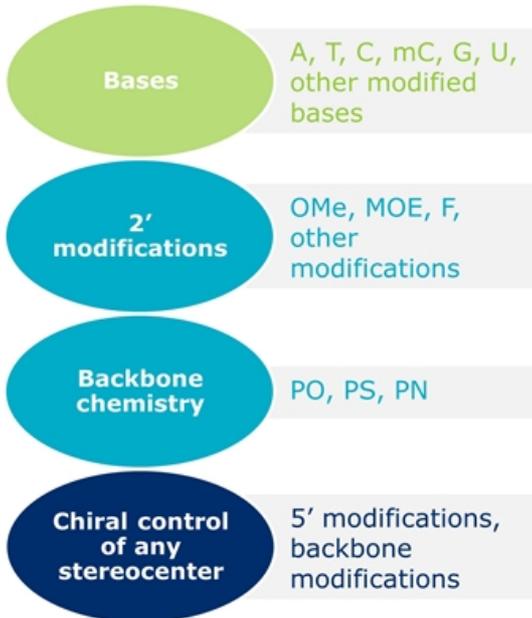

RNA Base Editing

- Efficient editing of RNA bases to **restore** or **modulate** protein function or production

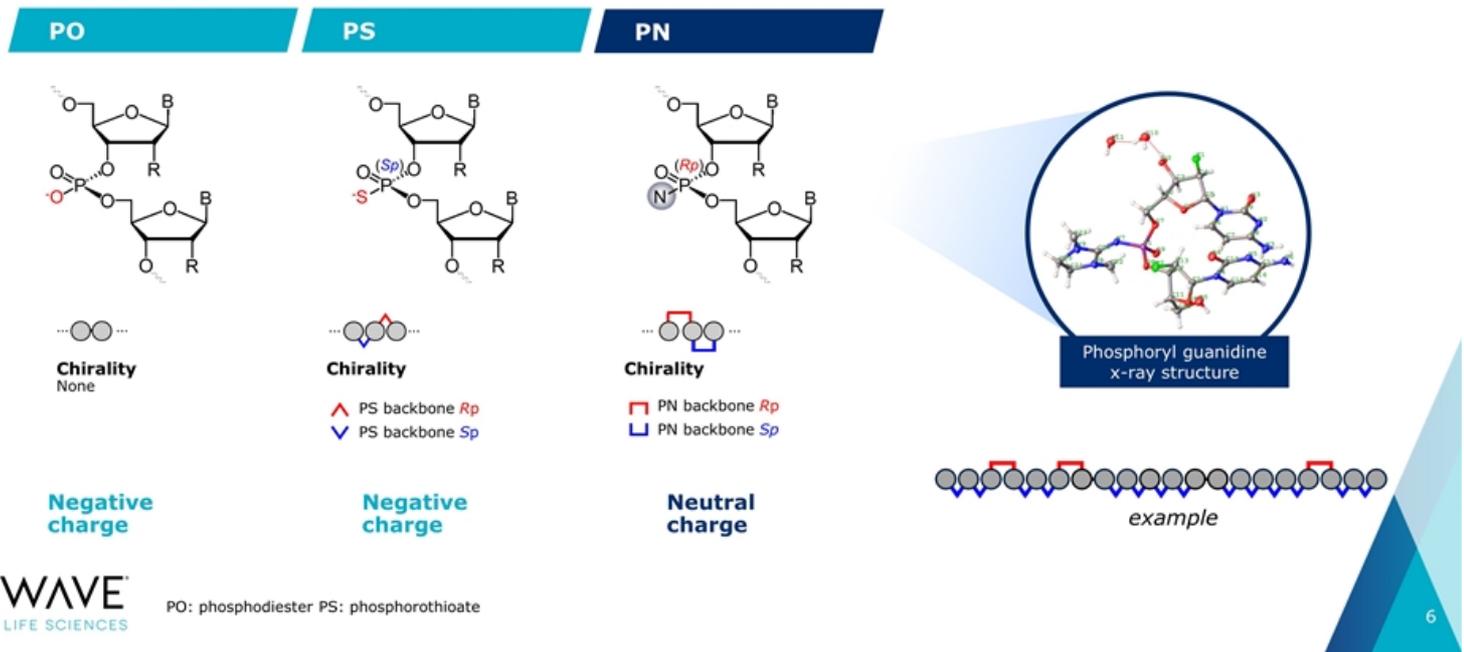

PRISM enables precision modulation of RNA therapeutic properties using unique chemistry toolkit

- Potency
- Tissue exposure
- Duration of activity

Innovating stereopure backbone chemistry modifications

PRISM backbone linkages

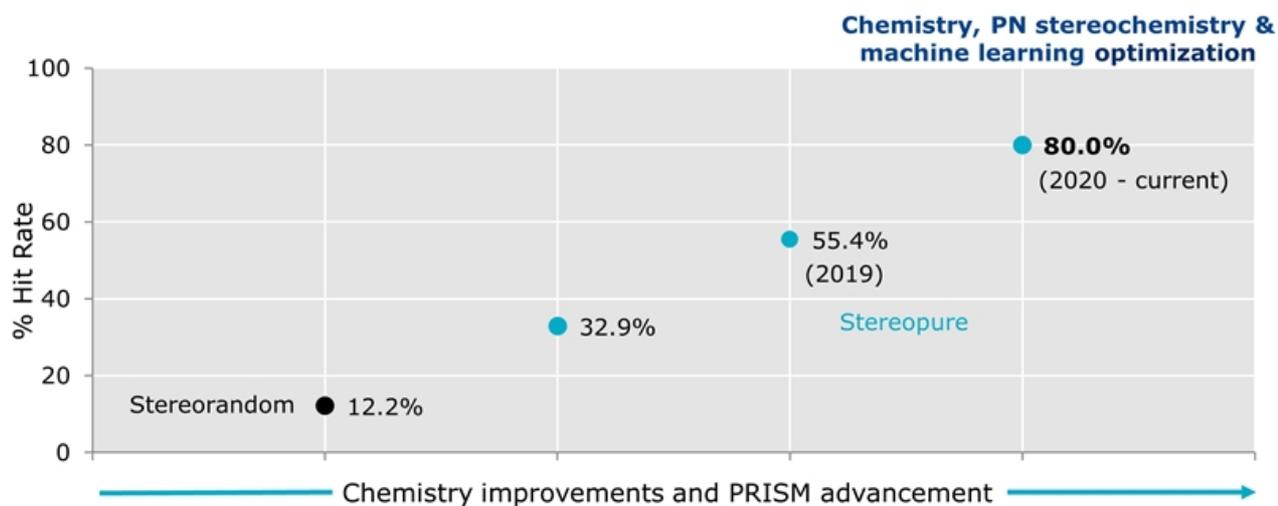

WAVE[™]
LIFE SCIENCES

PO: phosphodiester PS: phosphorothioate

Improvements in PRISM primary screen hit rates accelerate drug discovery

Primary screen hit rates with silencing far above industry standard hit rates

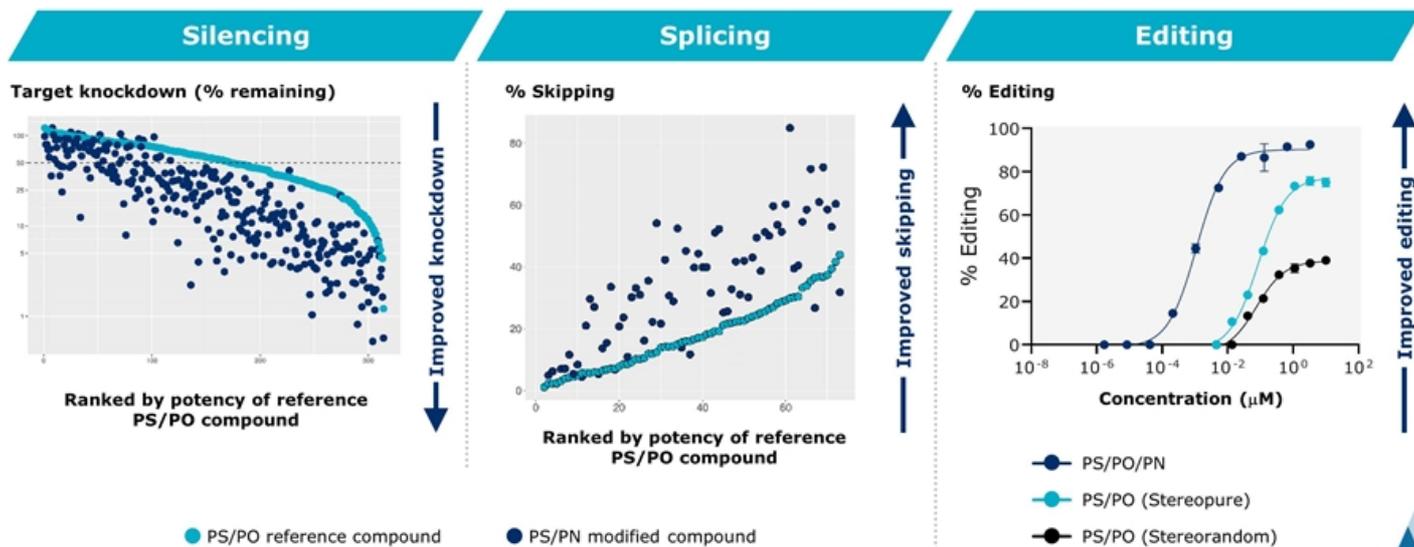

WAVE
LIFE SCIENCES

All screens used iPSC-derived neurons; Data pipeline for improved standardization. Hit rate = % of oligonucleotides with target knockdown greater than 50%. Each screen contains >100 oligonucleotides. ML: machine learning

PRISM

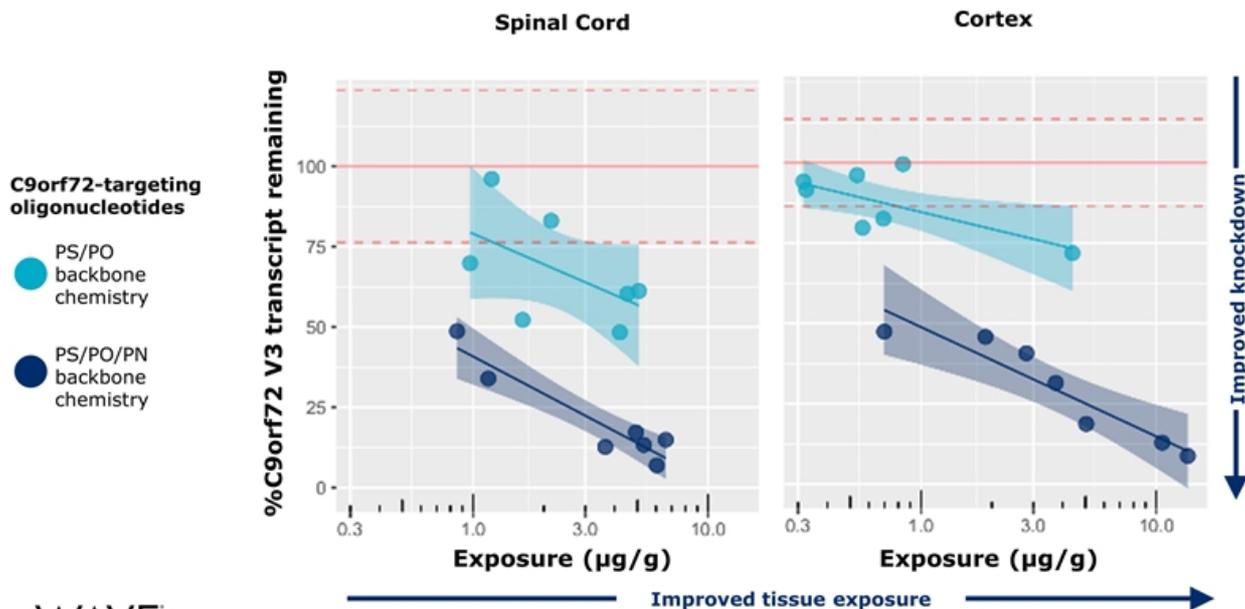

Potency is enhanced with addition of PN modifications across modalities

WAVE
LIFE SCIENCES

Left: Experiment was performed in iPSC-derived neurons *in vitro*; target mRNA levels were monitored using qPCR against a control gene (HPRT1) using a linear model equivalent of the $\Delta\Delta C_t$ method; Middle: DMD patient-derived myoblasts treated with PS/PO or PS/PO/PN stereopure oligonucleotide under free-uptake conditions. Exon-skipping efficiency evaluated by qPCR. Right: Data from independent experiments

Adding PN chemistry modifications to C9orf72-targeting oligonucleotides improved potency *in vivo*

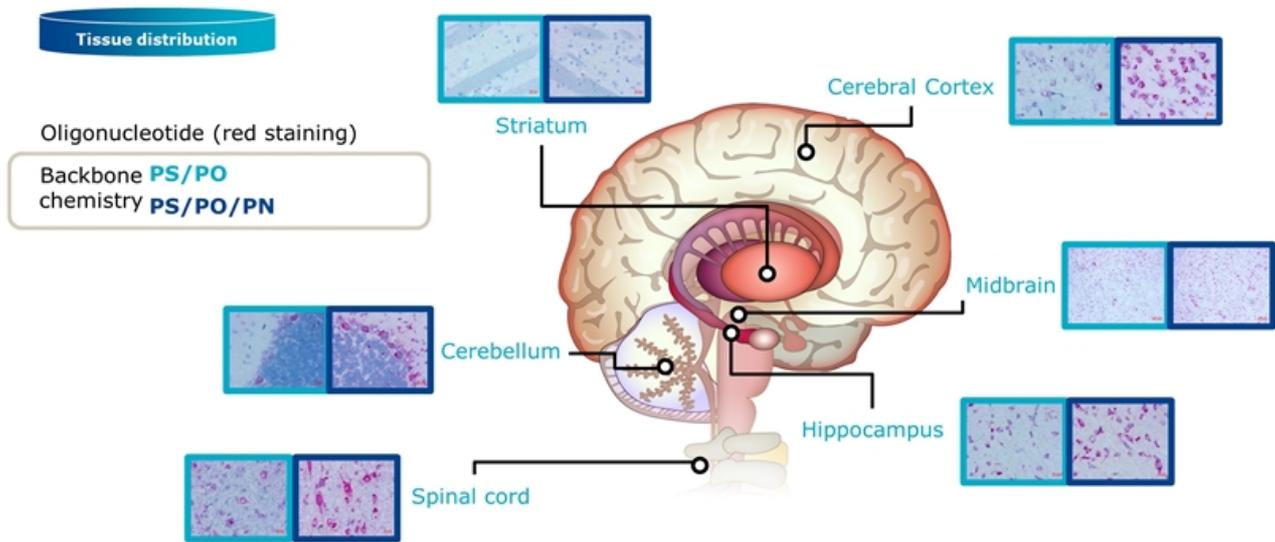

Target knockdown: Liu, TIDES poster 2021; Oligonucleotide concentrations quantified by hybridization ELISA. Graphs show robust best fit lines with 95% confidence intervals (shading) for PK-PD analysis. Manuscript submitted.

PN chemistry improves distribution to CNS

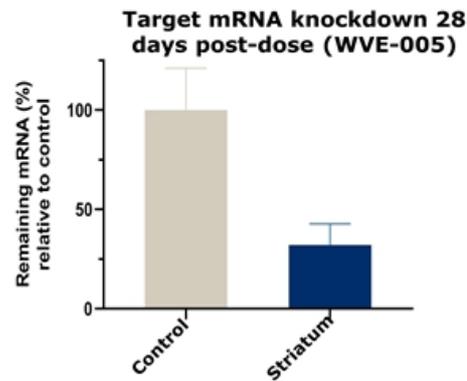

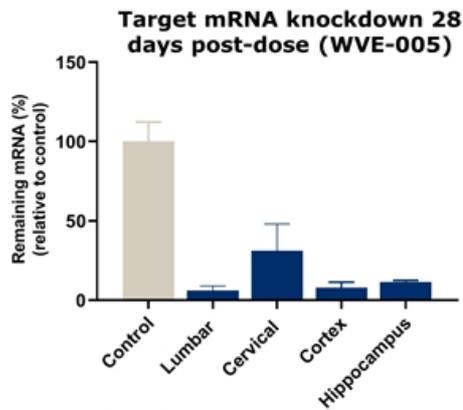

Distribution of oligonucleotides in NHP CNS 1-month post single IT dose

WAVE
LIFE SCIENCES

NHPs administered 1x12 mg oligonucleotide or PBS by intrathecal injection/lumbar puncture (IT). CNS tissue evaluated 11 or 29 days after injection (n=6 per group). Oligonucleotide was visualized by ViewRNA (red), and nuclei are counterstained with hematoxylin. Images from day 29.

Single intrathecal dose in NHP leads to substantial and widespread target mRNA reduction throughout the CNS

Potential for infrequent IT administration, widespread CNS distribution of PN modified oligonucleotides, and availability of disease biomarkers facilitates development of differentiated CNS portfolio

Robust portfolio of stereopure, PN-modified oligonucleotides

Dramatic increase in effect with PN-modified splicing oligonucleotide in dKO mouse model

Treatment with PN-modified molecules led to 100% survival of dKO mice at time of study termination

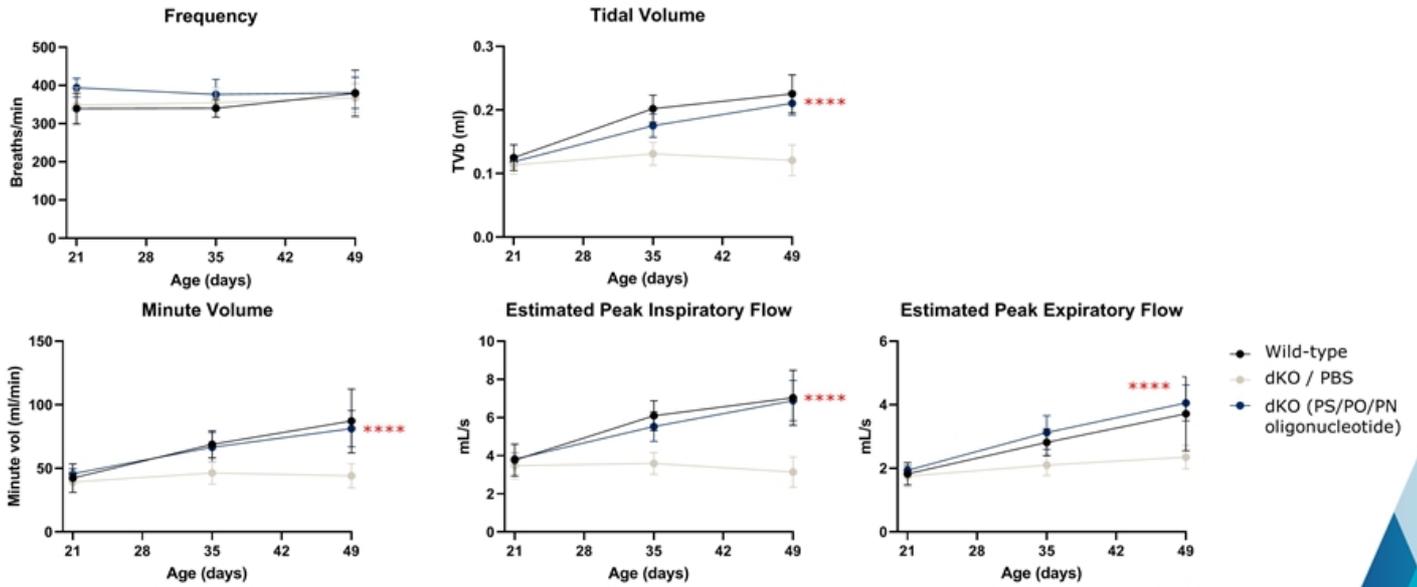

Note: Untreated, age-matched mdx mice had 100% survival at study termination [not shown]

dKO; double knockout mice lack dystrophin and utrophin protein. mdx mice lack dystrophin. dKO: PS/PO/PN 150 mg/kg n= 8 (p=0.0018); PS/PO/PN 75 mg/kg n=9 (p=0.00005); PS/PO n=9 (p=0.0024), PBS n=12 Stats: Chi square analysis with pairwise comparisons to PBS using log-rank test

PS/PO/PN slicing compound restores respiratory function to wild-type levels in dKO mice

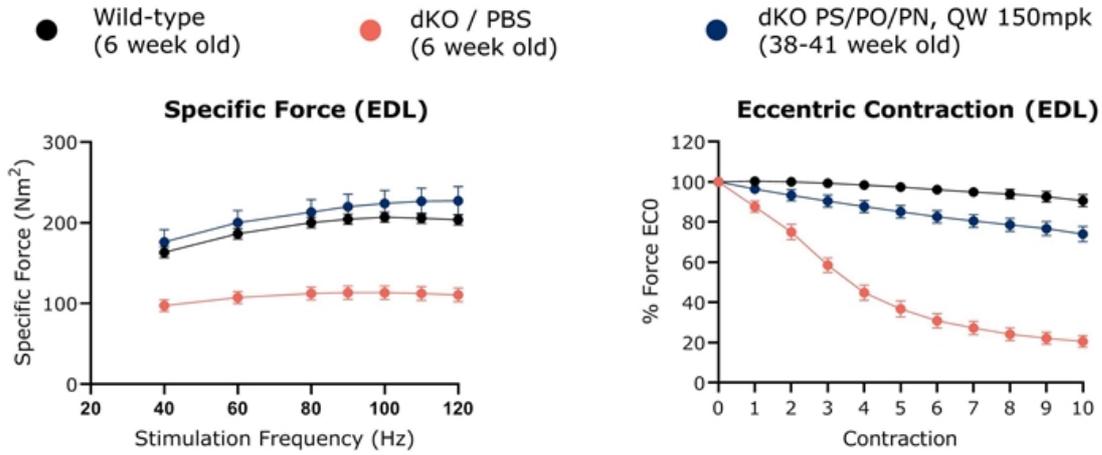

WAVE[™]
LIFE SCIENCES

Manuscript in press. 10 day old dKO mice received weekly subcutaneous 150 mg/kg doses of PS/PO/PN splicing compound or PBS. Age-matched C57Bl/6 wild-type mice were also included in study. Data are presented as mean \pm s.d. Stats from 2-way ANOVA **** P<0.0001.

PRISM

PS/PO/PN compound restores muscle function to wild-type levels in dKO mice

Clinical trial of WVE-N531 underway

- Unmet need in DMD remains high
- Open-label clinical trial of up to 15 boys with DMD amenable to exon 53 skipping
 - Powered to evaluate change in dystrophin expression
 - Possible cohort expansion driven by assessment of drug distribution in muscle and biomarkers, including dystrophin

Initial cohort

- Ascending doses of WVE-N531
- Up to 4 dose levels (administered ≥ 4 weeks apart) evaluated to select dose level for multidose
- Up to 3 additional doses given every-other-week at selected dose level

Possible cohort expansion

- Additional patients enrolled and dosed every other week at selected dose level
- Up to 7 total doses to be given followed by a minimum 8-week safety monitoring period

Dose level and dosing frequency guided by independent committee

C9orf72 repeat expansions: One of the most common genetic causes of ALS and FTD

Hexanucleotide (G₄C₂)- repeat expansions in C9orf72 gene are common autosomal dominant cause for ALS and FTD

Different manifestations across a clinical spectrum

Amyotrophic Lateral Sclerosis (ALS)

- Fatal neurodegenerative disease
- Progressive degeneration of motor neurons in brain and spinal cord
- C9-specific ALS: ~2,000 patients in US

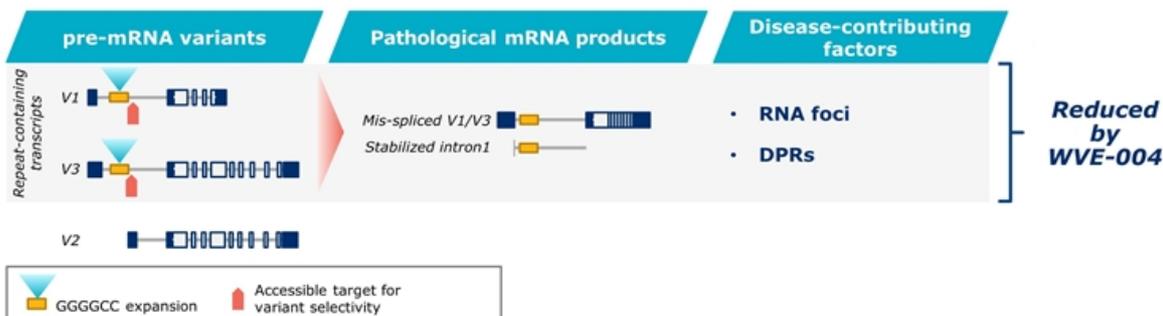

Frontotemporal Dementia (FTD)

- Progressive neuronal degeneration in frontal / temporal cortices
- Personality and behavioral changes, gradual impairment of language skills
- C9-specific FTD: ~10,000 patients in US

Including patients with C9-associated disease across phenotypes

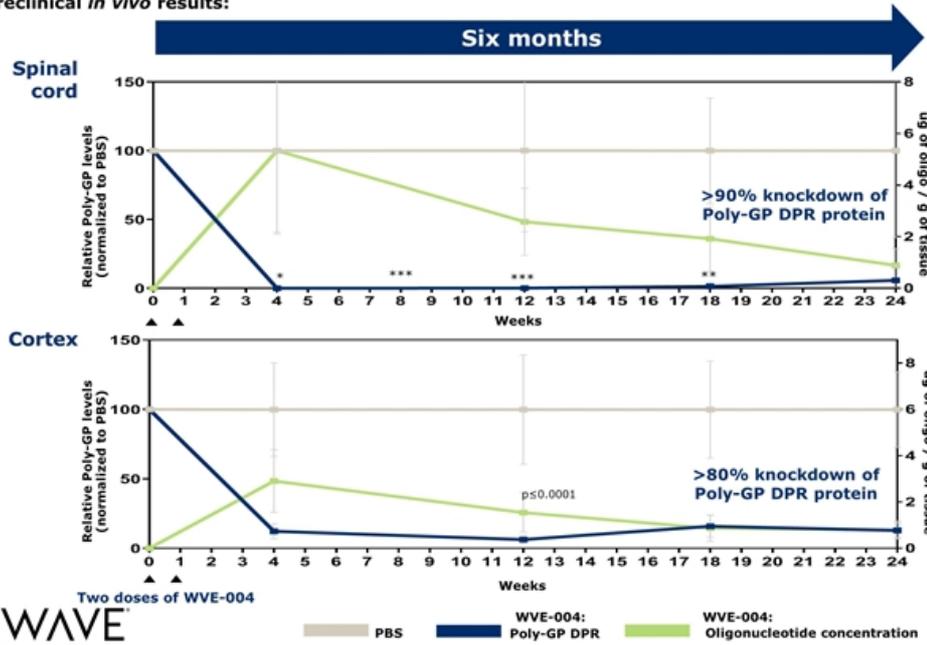

WVE-004 selectively targets repeat-containing transcripts to address multiple drivers of toxicity

- C9orf72 protein is important for normal regulation of neuronal function and the immune system
- WVE-004 targets hexanucleotide repeat containing transcript variants that lead to loss of normal C9orf72 function and production of pathological mRNA products and toxic dipeptide repeat (DPR) proteins
- Poly-GP is an important DPR transcribed from sense and antisense toxic mRNA transcripts
- Poly-GP is a sensitive biomarker of target engagement and reductions of mRNA transcripts and other toxic proteins by WVE-004
- Neurofilament Light-Chain (NfL) measurements will provide important insight into potential for neuroprotection

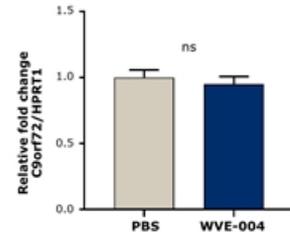

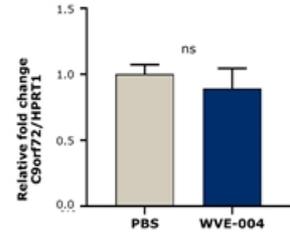

Durable reduction *in vivo* of Poly-GP in spinal cord and cortex after 6 months

Preclinical *in vivo* results:

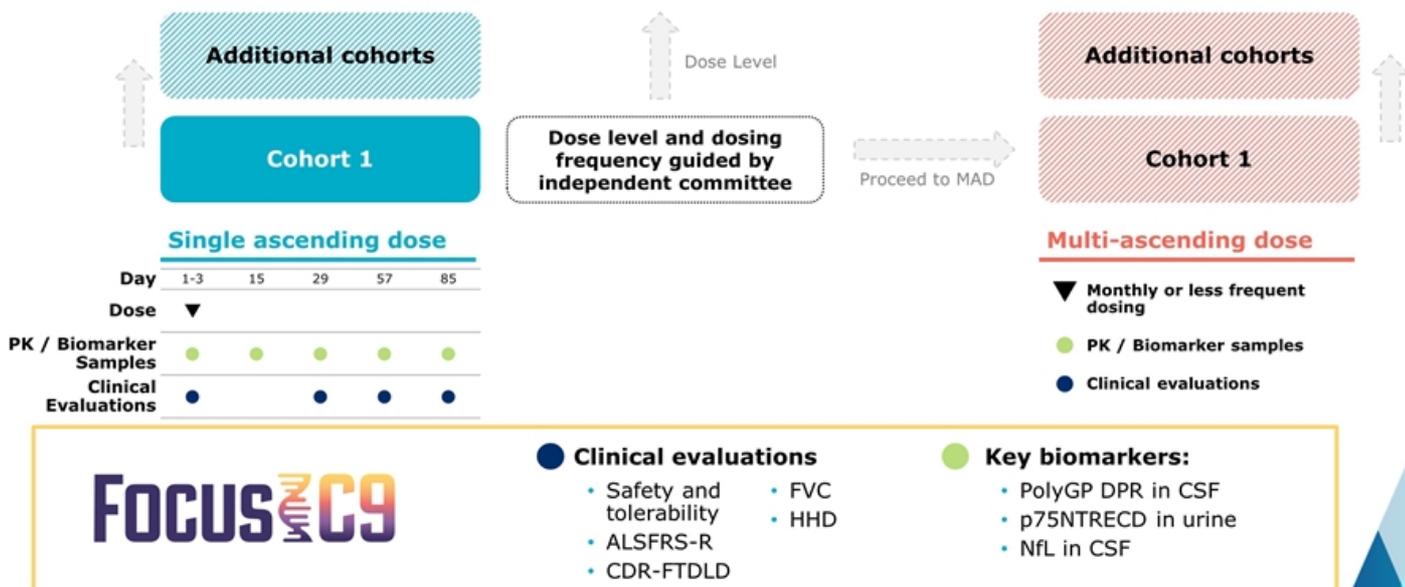

C9orf72 protein unchanged at 6 months

Full results presented at the 31st International Symposium on ALS/ MND (December 2020); 2 x 50 μ g (day 0, day 7) dosed ICV; DPRs measured by Poly-GP HSD assay. *: p \leq 0.05 **: P \leq 0.01, ***: P \leq 0.001. DPR: Dipeptide repeat protein

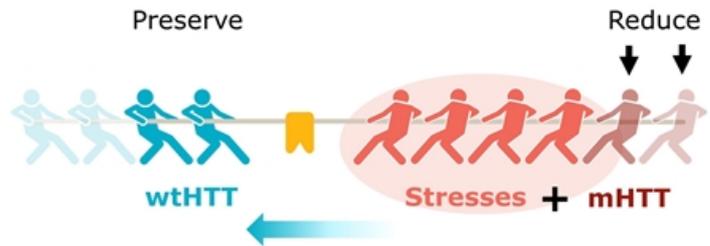

FOCUS-C9 clinical trial: Dose level and dosing frequency guided by independent committee

Allele-selective approach to treating HD

Wave has only allele-selective clinical program in Huntington's disease

- ✓ Target mutant mRNA HTT transcript to reduce mutant HTT protein
- ✓ Preserve wild-type HTT protein reservoir in brain

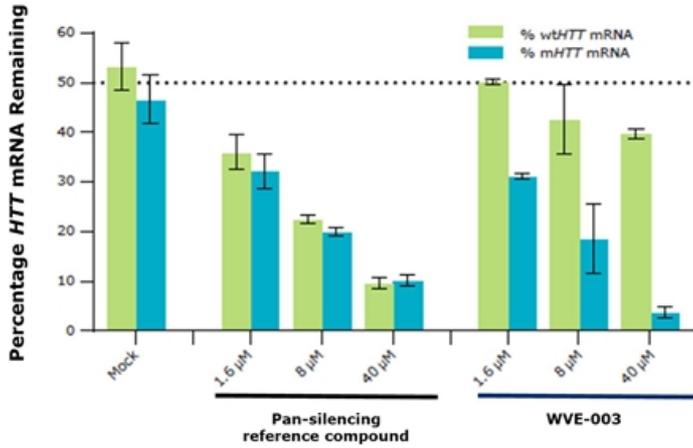

Only an allele-selective approach is designed to address both toxic gain of function and toxic loss of function drivers of HD

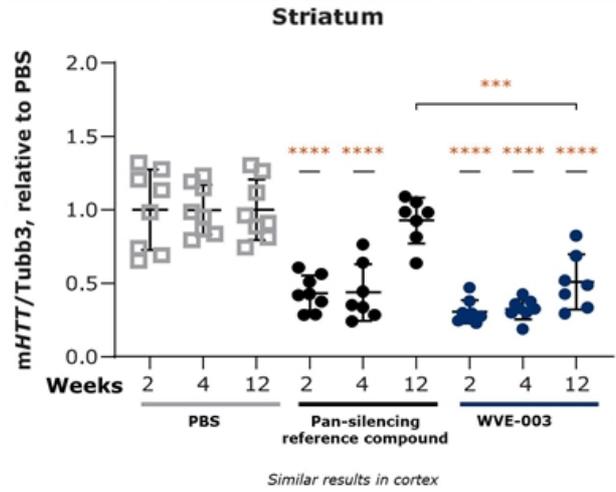

WVE-003 (SNP3) demonstrates selective, potent, and durable reduction of mHTT in preclinical models

Incorporates PN backbone chemistry modifications

Selectively reduces mHTT mRNA in HD iPSC neurons in vitro

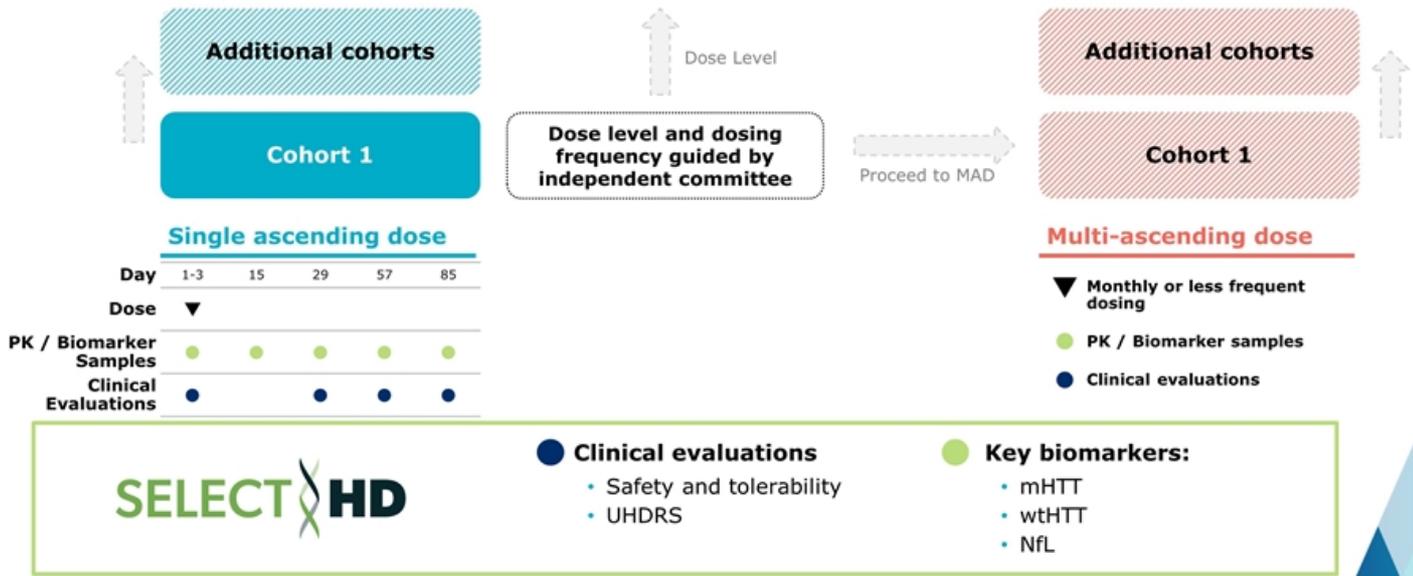

Durable striatal mHTT knockdown for 12 weeks in BACHD mouse model

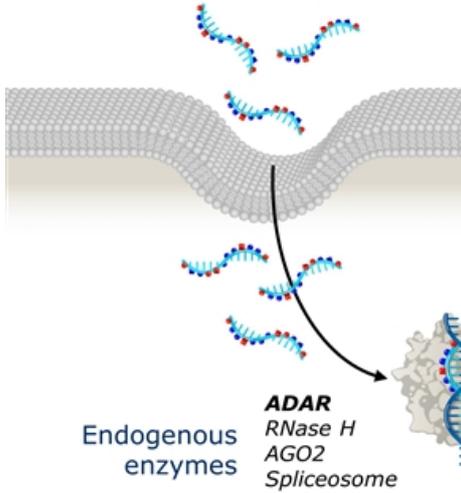

Results from NDS0036 iPSC-derived medium spiny neurons. Total *HTT* knockdown quantified by qPCR and normalized to *HPRT1*. Oligonucleotide or PBS [100 μg ICV injections through cannula on days 1, 3, 5] delivered to BACHD transgenic. Mean ± SD (n=8, **P*<0.0332, ****P*<0.0002, *****P*<0.0001 versus PBS unless otherwise noted). *HPRT1*, hypoxanthine-guanine phosphoribosyl transferase; iPSC, induced pluripotent stem cell; ICV, intracerebroventricular; PBS, phosphate-buffered saline

SELECT-HD clinical trial: Dose level and dosing frequency guided by independent committee

Unlocking RNA editing with PRISM platform to develop AIMers: A-to-I editing oligonucleotides

Free-uptake of chemically modified oligonucleotides

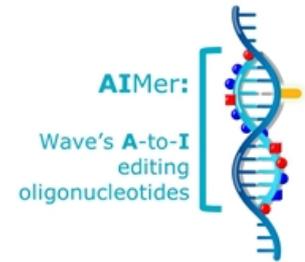

Endogenous enzymes

ADAR
RNase H
AGO2
Spliceosome

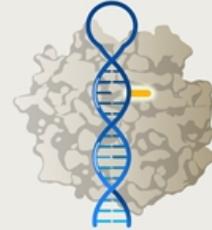

- First publication (1995) using oligonucleotide to edit RNA with endogenous ADAR¹
- Wave goal: Expand toolkit to include editing by unlocking ADAR with PRISM oligonucleotides

- ✓ Learnings from biological concepts
- ✓ Applied to ASO structural concepts
- ✓ Applied PRISM chemistry

ADAR enzymes

- Catalyze conversion of A-to-I (G) in double-stranded RNA substrates
- A-to-I (G) edits are one of the most common post-transcriptional modifications
- ADAR1 is ubiquitously expressed across tissues, including liver and CNS

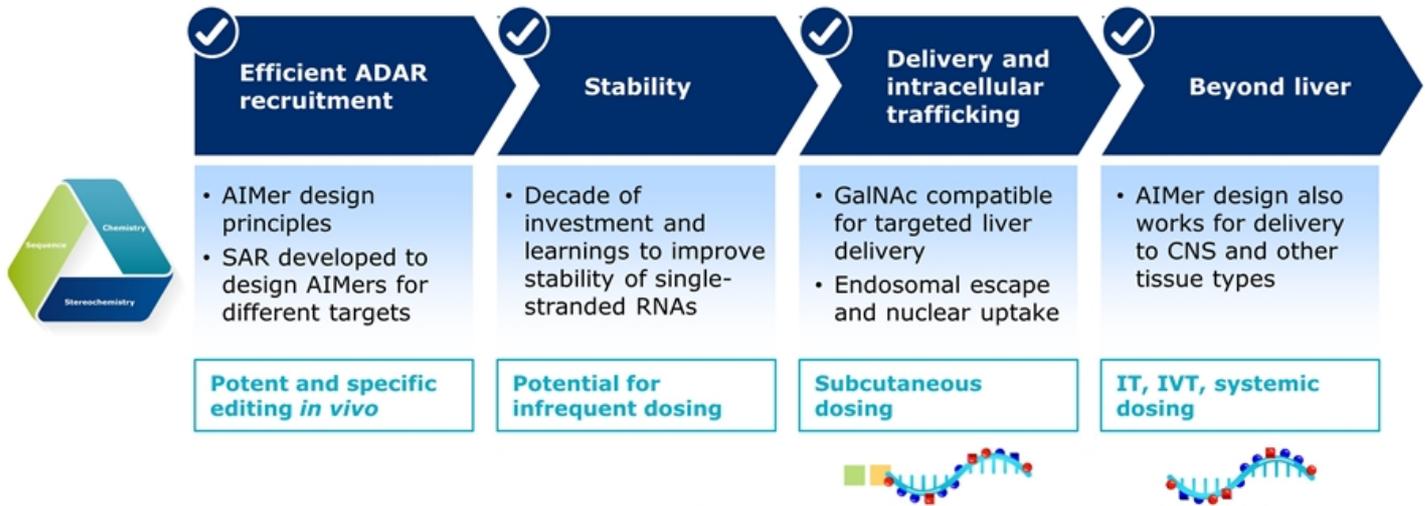

WAVE
LIFE SCIENCES

¹Woolf et al., PNAS Vol. 92, pp. 8298-8302, 1995

AIMers: Realizing potential of therapeutic RNA editing by harnessing endogenous ADAR

Solved for key therapeutic attributes for potential best-in-class RNA editing therapeutics

- Systematized AIMer design enables rapid advancement of new targets
- Strong and broad IP in chemical and backbone modifications, stereochemistry patterns, novel and proprietary nucleosides

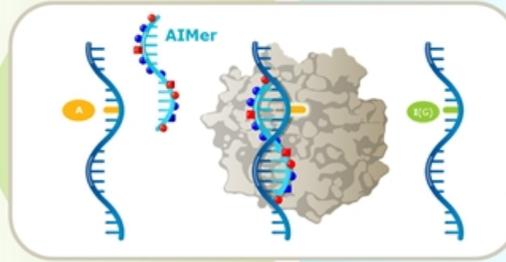

Opportunity for novel and innovative AIMer therapeutics

Correct driver mutations with AIMers

Examples

AATD
Rett syndrome
Recessive or dominant genetically defined diseases

Restore or correct protein function

Modulate protein interactions with AIMers

Upregulate expression
Modify function
Modulate protein-protein interaction
Post-translational modification
Alter folding or processing

Examples

Haploinsufficient diseases
Loss of function
Neuromuscular
Dementias
Familial epilepsies
Neuropathic pain

- >32,000 pathogenic human SNPs² – ~50% ADAR amenable
- Tens of thousands of potential amenable disease variants¹
- ~12% of all reported disease-causing mutations are single point mutations that result in a premature stop codon³

- Large patient populations
- Human Reference Interactome documents >50K protein-protein interactions involving >8K proteins⁴
- >90K Post-translational modifications across ~30K proteins mapped,⁵ thousands associated with disease⁶

WAVE
LIFE SCIENCES

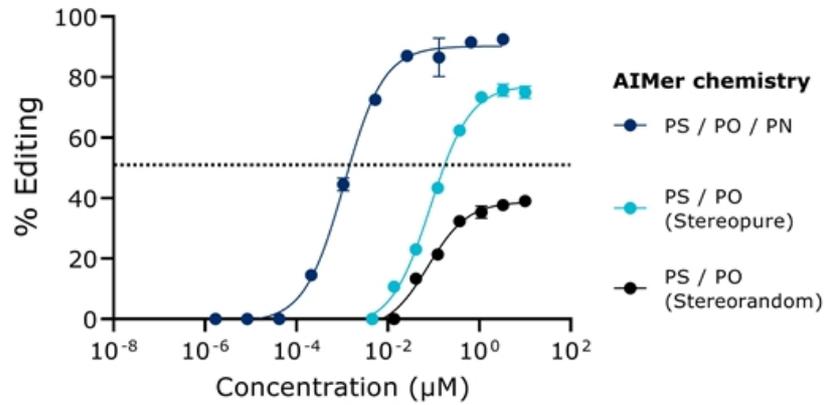

SNP: single nucleotide polymorphism A: Adenosine I: Inosine G: Guanosine

¹ClinVar database ²Gaudeli NM et al. *Nature* (2017) ³Keeling KM et al., *Madame Curie Bioscience Database* 2000-2013 ⁴Luck, K et al. *Nature* (2020)

⁵Prasad, TSK et al. *Nucleic Acids Research* (2009) ⁶Huang, K et al. *Nucleic Acids Research* (2016)

Stereochemistry and PN chemistry enhance potency and editing efficiency of AIMers

ACTB editing in primary human hepatocytes using GalNAc-mediated uptake

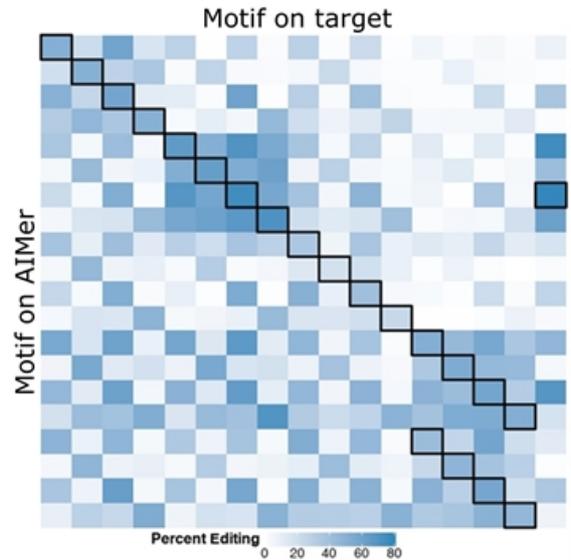

Optimization of every dimension to inform future rational design of AIMers

Heat map for sequence impact on SAR

Example: Sequence is one of multiple dimensions for optimization

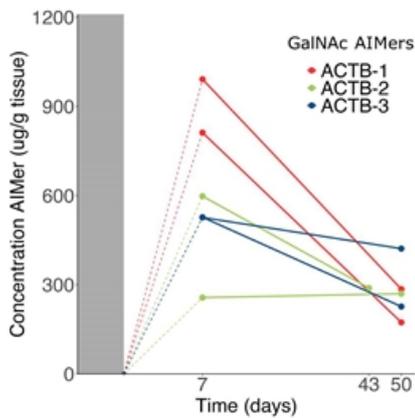

- >300 unique AIMers tested containing different base pair combinations
- Identified base modification combinations with high editing efficiency to optimize sequence

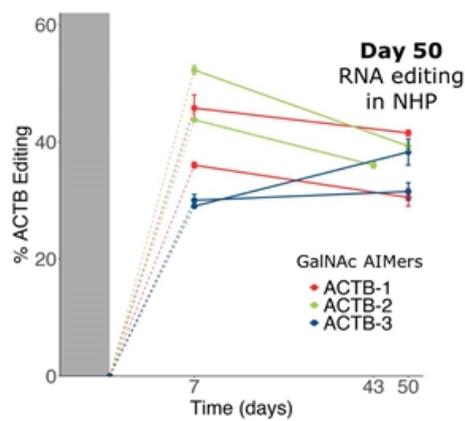

Stability of AIMers enables durable and specific editing out to Day 50 in liver of NHPs

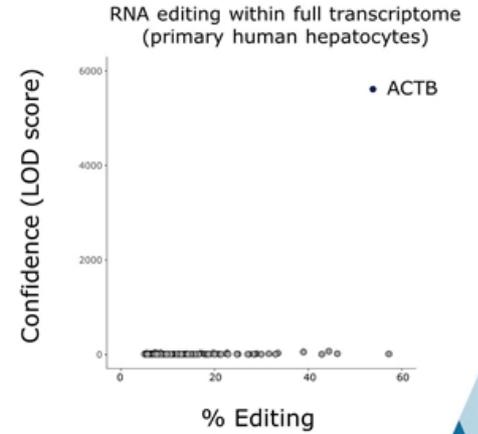

AIMers detected in liver of NHP at Day 50 (PK)

Substantial and durable editing in NHP liver *in vivo* (PD)

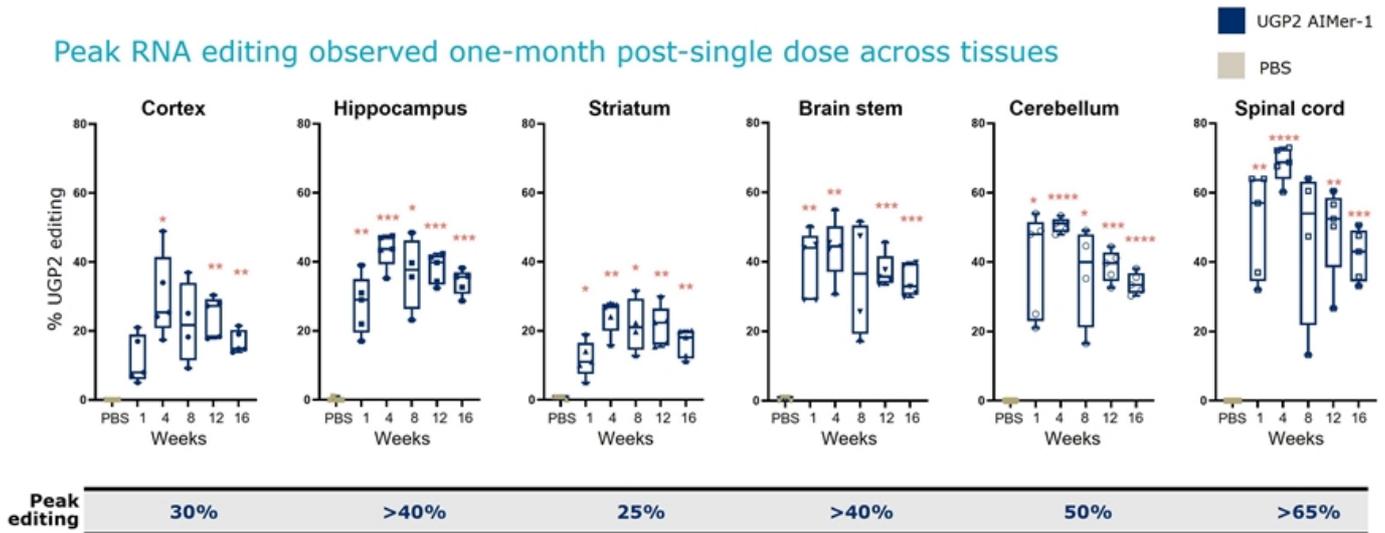

ADAR editing with ACTB AIMER is highly specific

RNA editing only detected at editing site in ACTB transcript

Substantial *in vivo* RNA editing out to at least 4 months post-single dose in CNS tissues

Peak RNA editing observed one-month post-single dose across tissues

WAVE
LIFE SCIENCES

Transgenic huADAR mice administered 100 μ g AIMer or PBS on day 0 and evaluated for UGP2 editing across CNS tissues at 1, 4, 8, 12, and 16-weeks post dose. Percentage UGP2 editing determined by Sanger sequencing. Stats: 2-way ANOVA compared to PBS (n=5 per time point per treatment) *P<0.05, **P<0.01, ***P<0.001, ****P<0.0001. ICV intracerebroventricular; PBS phosphate buffered saline

RNA editing of nonsense mutation found in MECP2 (Rett Syndrome) restores functional protein

Normal: ... CGA... wild type protein
 Rett Syndrome: ... TGA... premature stop codon
 ADAR editing: ... TGG... restored protein

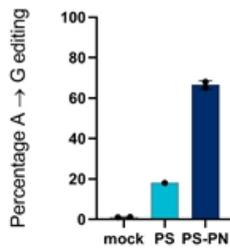

Variant base
 ADAR editing site

Nonsense mutations found in Rett Syndrome can occur in multiple locations on RNA transcript:

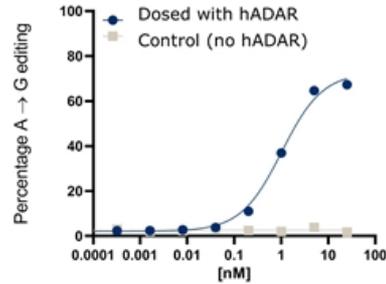

in vitro ADAR editing of over 60% targeting MECP2 disease transcript

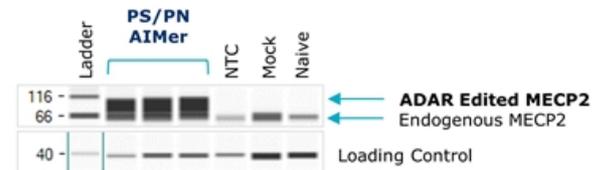

PN chemistry improved editing efficiency *in vitro*

Dose-dependent RNA editing of MECP2 mutation with PS/PN AIMER

Full length MECP2 protein is expressed following ADAR editing

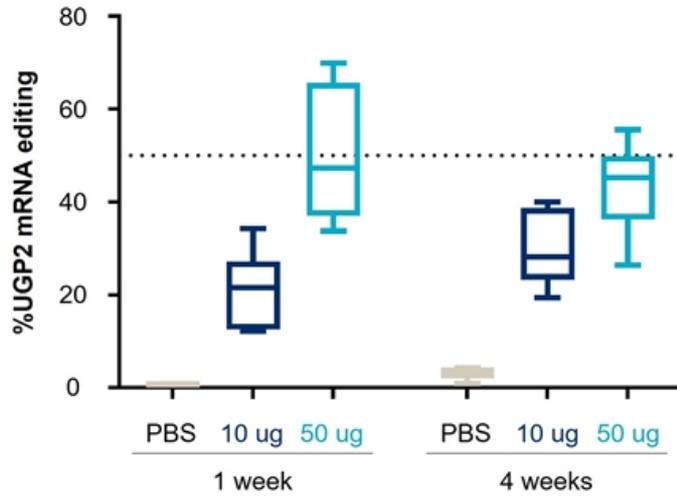

WAVE
LIFE SCIENCES

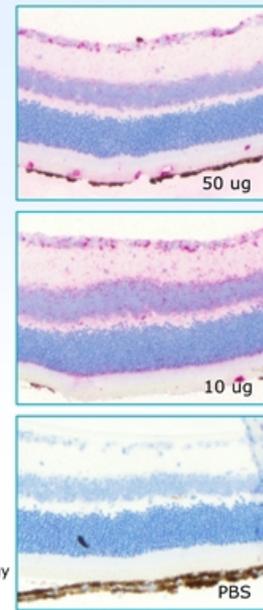

293T cells transfected with both nonsense mutation on MECP2 (GFP-fusion construct) and ADAR plasmids. Aimers transfected for 48h prior to RNA extraction and sequencing. Percentage editing determined by Sanger sequencing. Left: Single dose (25nM) treatment Middle: Full dose response curve (25nM, 5-fold dilution, 48h treatment) in presence or absence of hADAR Right: Western blot for MECP2 protein. Three biological replicates, NTC AIMER, mock and naive 293T cells probed for fusion protein.

ADAR editing: Up to 50% editing *in vivo* in posterior of eye one month post-single IVT dose

Durable, dose-dependent editing post-single intravitreal dose of UGP2 AIMer-1

AIMers in retina at 4 weeks

Mice received a single IVT injection (10 or 50 ug AIMer), and eyes were collected for RNA analysis and histology 1 or 4 weeks later. Left: editing evaluated by Sanger sequencing, and % RNA editing calculated with EditR. Right: FFPE and RNA scope assay specific for AIMer, red = oligo, blue = nuclei. Posterior region: retina, choroid, sclera.

Achieving productive editing in multiple NHP tissues with unconjugated systemic AIMer delivery

✓ GalNAc-conjugated (*Targeted - subcutaneous*)

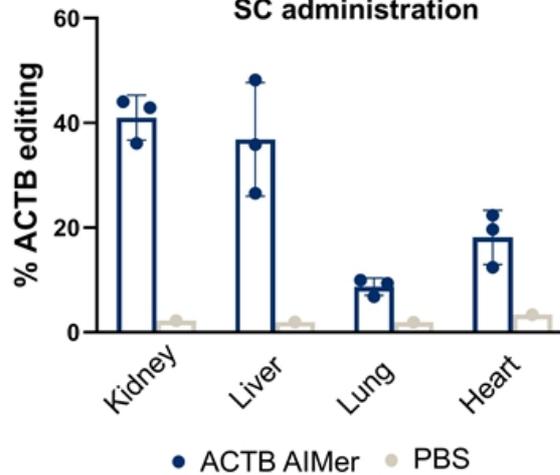

✓ Unconjugated (*Local - IVT, IT*)

✓ **Unconjugated (*Systemic*)**

- NHP study demonstrated productive editing in kidney, liver, lung and heart with single subcutaneous dose

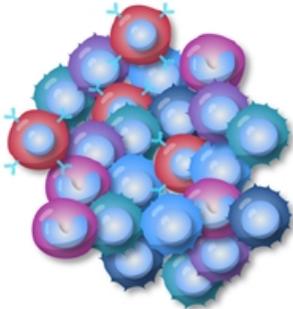

Editing in NHP 1-week post-single dose SC administration

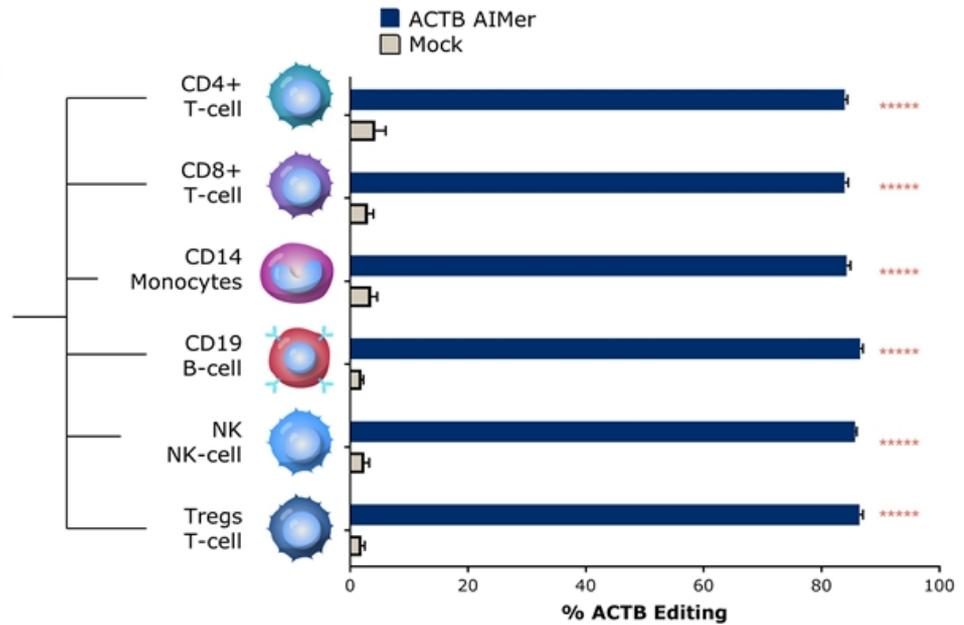

Achieving productive editing in multiple immune cell types with AIMers *in vitro*

Human peripheral blood mononuclear cell (PBMC)

Activate (PHA) → Dose → Sort

WAVE
LIFE SCIENCES

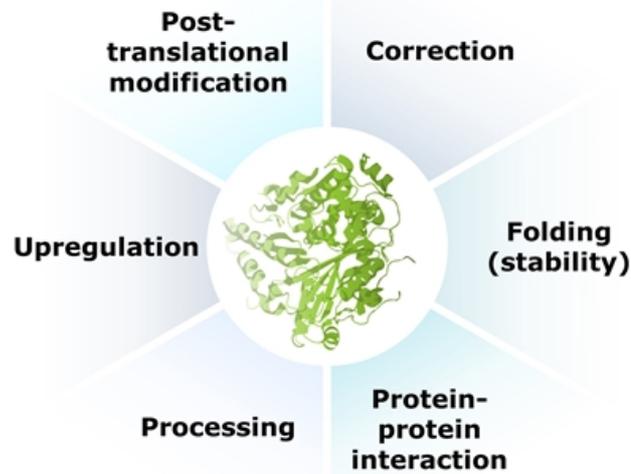

Human PBMCs dosed with 10 μ M ACTB AIMers, under activating conditions (PHA). After 4 days, different cell types isolated, quantitated for editing %. ACTB: Beta-actin; Two-way ANOVA followed by post hoc comparison per cell line. P values were Bonferroni-corrected for multiple hypotheses

Expanding addressable disease target space using ADAR editing to modulate proteins

ADAR editing of mRNA

Restore or modify protein function

Impact diseases

Examples:

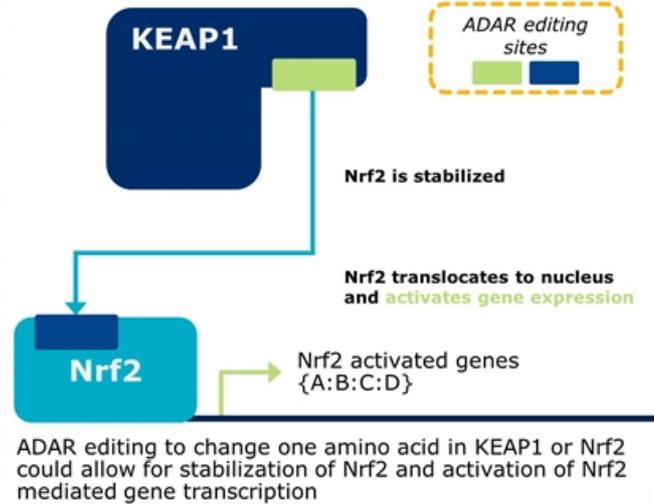

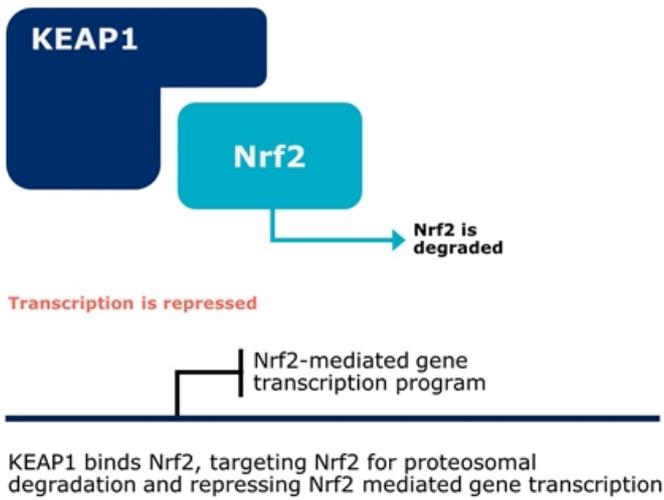

- Familial epilepsies
- Neuropathic pain
- Neuromuscular disorders
- Dementias
- Haploinsufficient diseases
- Loss of function

ADAR to modify protein-protein interactions

Basal conditions

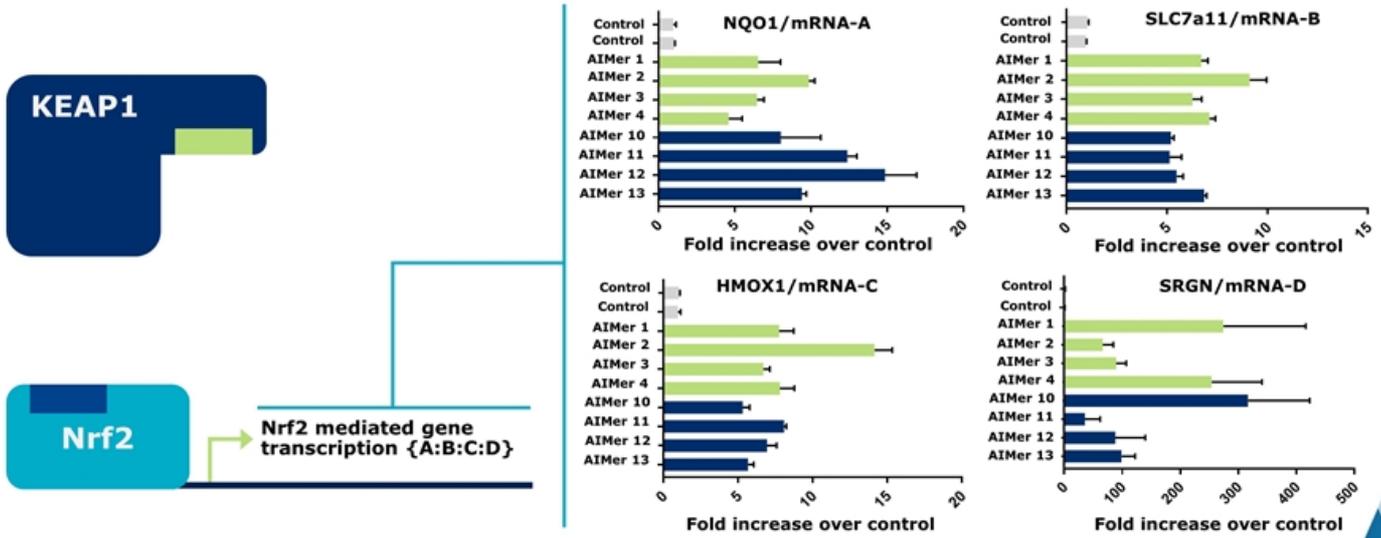

ADAR modified pathway

ADAR editing activates multiple genes confirming disrupted protein-protein interaction *in vitro*

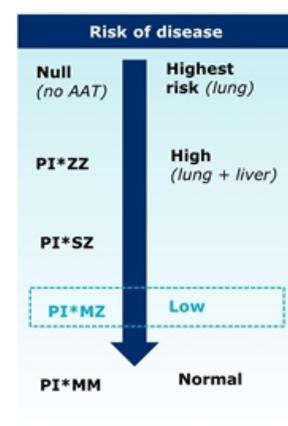

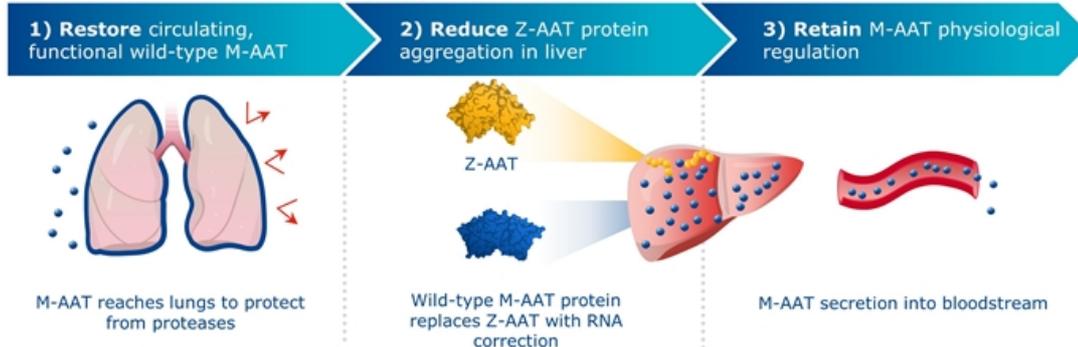

ADAR editing of either KEAP1 or Nrf2 directs gene activation

RNA editing is uniquely suited to address the therapeutic goals for AATD

Wave ADAR editing approach addresses all goals of treatment:

Alternative approaches address only a subset of treatment goals:

Current protein augmentation addresses only lung manifestations

siRNA approaches only address the liver disease

Small molecule approaches may address the lung and liver but do not generate wildtype M-AAT

~200K people in US and EU with mutation in *SERPINA1* Z allele (PI*ZZ)

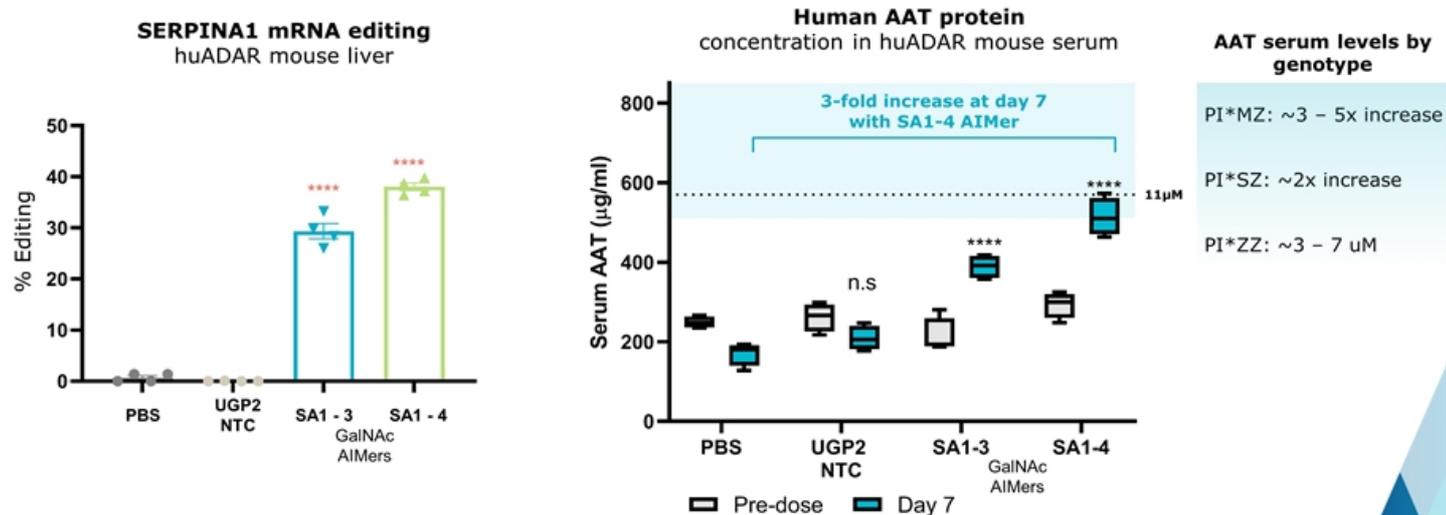

AAT: Alpha-1 antitrypsin; Sources: Strnad 2020; Blanco 2017; Remih 2021

RNA editing of 40% results in therapeutically meaningful increases in circulating AAT protein

SERPINA1 Z allele mRNA editing levels nearing correction to heterozygote (MZ)

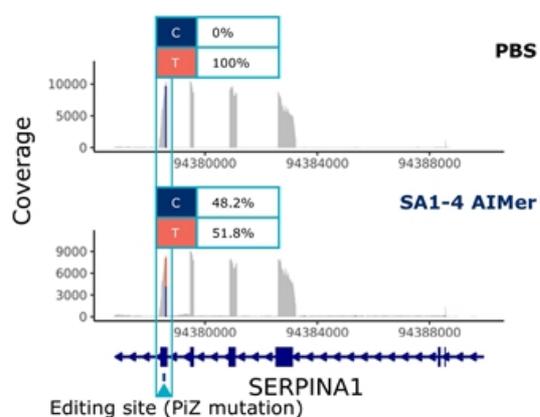

WAVE
LIFE SCIENCES

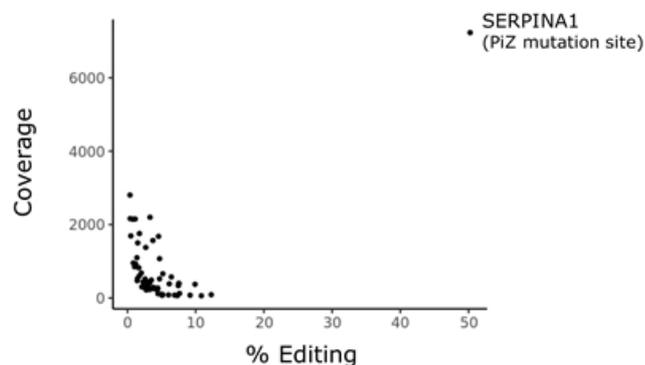

huADAR/*SERPINA1* mice administered PBS or 3 x 10 mg/kg AIMER (days 0, 2, and 4) SC. Samples collected day 7. Stats: One-way ANOVA; NTC: non-targeting control; Right: Statistics (ELISA): Matched 2-way ANOVA with correction for multiple comparisons (Bonferroni) was used to test for differences in AAT abundance in treated samples compared to PBS Statistics; de Serres et al., J Intern Med. 2014; NTC: non-targeting control

ADAR editing is highly specific; no bystander editing observed on SERPINA1 transcript

RNA editing only detected at PiZ mutation site in SERPINA1 transcript (mouse liver)

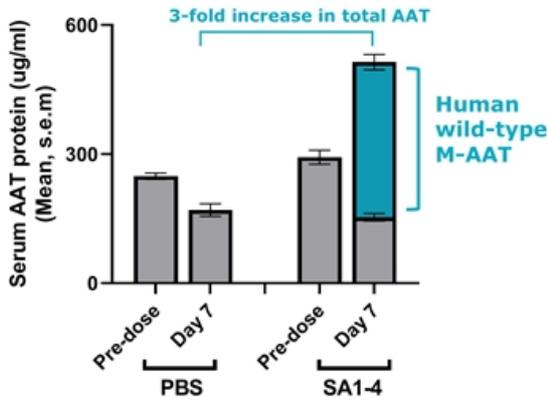

RNA editing within transcriptome (mouse liver)

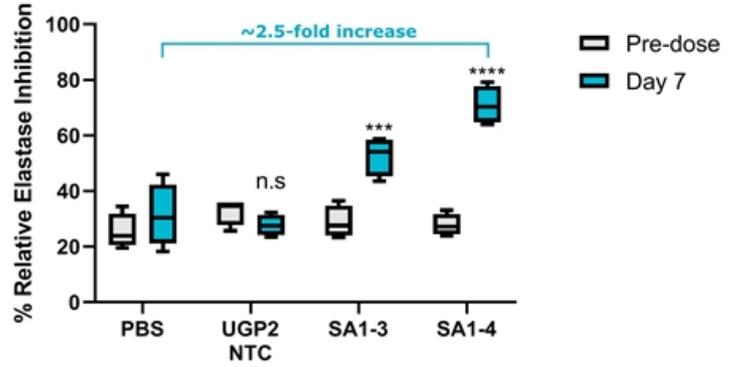

ADAR editing restores circulating, functional M-AAT

Wild-type M-AAT detected with ADAR editing

Significant increase in neutrophil elastase inhibition with ADAR editing

- Z allele mRNA editing *in vivo*
- AAT protein increase
- Wild-type M-AAT functional

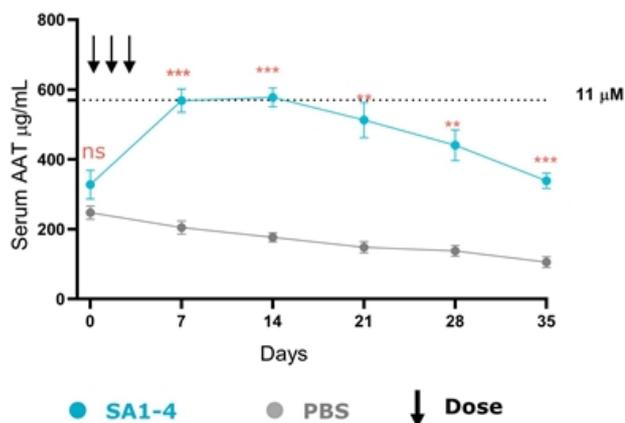

Left: Mass spectrometry and ELISA Right: (Elastase inhibition): Matched 2-way ANOVA with correction for multiple comparisons (Bonferroni) was used to test for differences in elastase inhibition activity in serum collected at day 7 vs pre-dose for each treatment group; NTC: non-targeting control

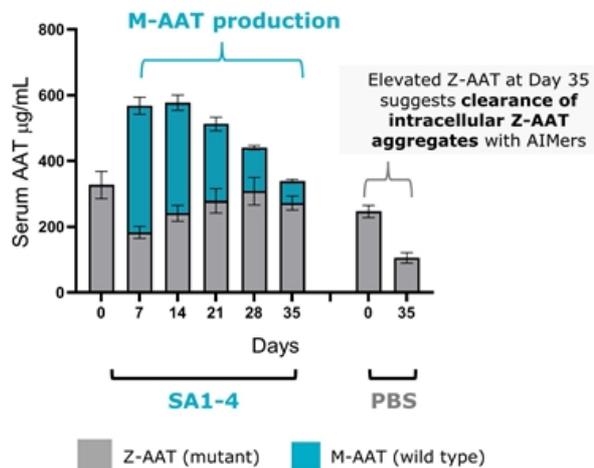

Increase in circulating human AAT is durable, with restored M-AAT detected one month post last dose

Human AAT serum concentration ≥ 3 -fold higher over 30 days post-last dose

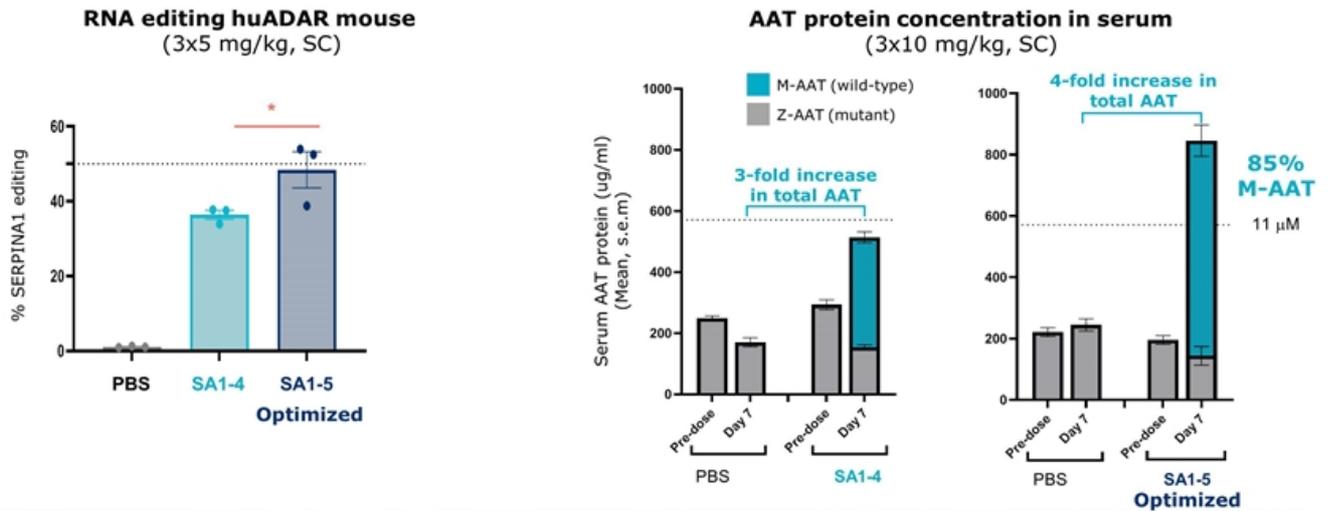

Restored wild-type M-AAT detected over 30 days post-last dose

WAVE[™]
LIFE SCIENCES

SA1-4: GalNAc AIMER (Left) huADAR/SERPINA1 mice administered PBS or 3 x 10 mg/kg AIMER (days 0, 2, and 4) SC. AAT levels quantified by ELISA. Data presented as mean \pm sem. Stats: Matched 2-way ANOVA ns nonsignificant, ** $P < 0.01$, *** $P < 0.001$. (Right) Proportion of AAT in serum, Z type (mutant) or M type (wild type), measured by mass spectrometry, total AAT levels quantified by ELISA

Optimized AIMers achieve ~50% mRNA editing and restore AAT protein well above therapeutic threshold

- Additional preclinical data expected in 2022, including reduction in Z-AAT aggregates and changes in liver pathology
- AATD AIMER development candidate expected in 2022

Upcoming milestones throughout 2022 will unlock opportunities
